INTRODUCTION

Purpose and Scope

The primary objectives of this study are: (a) to update records in the ground-water pumping and water level monitoring programs for refinement of the digital computer model of the Carrizo aquifer which is used to evaluate the aquifer's response to pumping and the probable future ground-water conditions; and (b) to continue the water quality monitoring program.

Collection of basic data, in addition to the above, included the inventory of high capacity wells drilled between the Spring of 1970 and the Spring of 1977. The data presented in this report are supplementary to those in Texas Water Development Board Report 210, Volumes I and II.

This report was prepared under the general direction of C. R. Baskin, director, Data and Engineering Services Division and Tommy R. Knowles, chief, Data Collection and Evaluation Section.

Location and Extent of Area

The area covered by this report, which is referred to as the Winter Garden area, is the area southwest of the San Marcos River in which the Carrizo aquifer contains fresh to slightly saline water. It consists of all or parts of Atascosa, Bexar, Caldwell, Dimmit, Frio, Gonzales, Guadalupe, Karnes, La Salle, Live Oak, McMullen, Maverick, Medina, Uvalde, Webb, Wilson, and Zavala Counties. Although the maps in this report extend east of the San Marcos River, all numbers in the report concerning volume of ground water apply only to areas west of the San Marcos River. The Winter

Garden Area (west of the San Marcos River) consists of approximately 11,800 square miles ($30,600 \text{ km}^2$) and represents about 4.5 percent of the state's total area. Within the Winter Garden area is the Winter Garden district, an irrigated region which produces vegetables in late Winter and early Spring in Dimmit, Zavala, and eastern Maverick Counties (Figure 1).

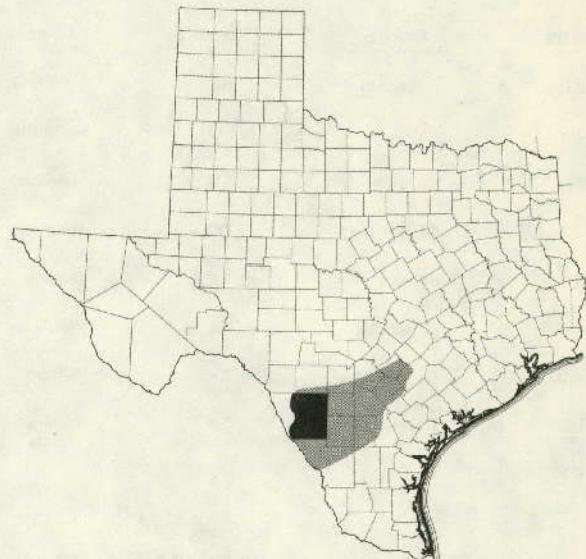

Figure 1.—Location and Extent of the Winter Garden Area and the Winter Garden District

WELL-NUMBERING SYSTEM

The well-numbering system used in this report is one adopted by the Texas Department of Water Resources for use throughout the state. This system facilitates the location of wells and prevents duplication of well numbers in present and future studies. Each well is assigned a seven-digit number which is derived by using the following system

The state is divided into 1-degree quadrangles of latitude and longitude which are numbered 01 through 89. These are the first two digits in the well number. Each 1-degree quadrangle is divided into 7½-minute quadrangles which are given two-digit numbers from 01 to 64. These are the third and fourth digits of the well number. Each 7½-minute quadrangle is divided into 2½-minute quadrangles which are given a single-digit number from 1 to 9. This is the fifth digit of the well number. Finally, each well within a 2½-minute quadrangle is given a two-digit number in the order in which it was inventoried, starting with 01. These are the last two digits of the well number.

On the well location map (Figure 6), only the last three digits are shown at each well location; the second two digits are shown in the northwest corner of each 7½-minute quadrangle; and the first two digits are shown by the large block numerals.

In addition to the seven-digit well number, a two-letter prefix is used to identify the county. The prefixes for the counties entirely or partially covered by this report are:

<u>Prefix</u>	<u>County</u>	<u>Prefix</u>	<u>County</u>
AL	Atascosa	SJ	Live Oak
AY	Bexar	SU	McMullen
BU	Caldwell	TB	Maverick
HZ	Dimmit	TD	Medina
KB	Frio	YP	Uvalde
KR	Gonzales	YZ	Webb
KX	Guadalupe	ZL	Wilson
PZ	Karnes	ZX	Zavala
RX	La Salle		

For example, well AL 68-51-404 is in Atascosa County (AL); 1-degree quadrangle 68; 7½-minute quadrangle 51; 2½-minute quadrangle 4; and was the fourth well inventoried in that 2½ minute quadrangle.

Metric Conversions

For those readers interested in using the International System (SI) of Units, the metric equivalents of English units of measurements are given in parentheses in the text. The English units used in this report may be converted to metric units by the following conversion factors:

<u>From English Units</u>	<u>Multiply By</u>	<u>To Obtain Metric Units</u>
acre-feet	0.00123	cubic hectometers (hm^3)
feet (ft)	0.3048	meters (m)
gallons per minute gal/min	0.0631	liters per second (l/s)
inches (in)	2.540	centimeters (cm)
square miles (mi^2)	2.590	square kilometers (km^2)

To convert degrees Fahrenheit to degrees Celsius are the following formula

$${}^\circ\text{C}=0.556 \ ({}^\circ\text{F}-32)$$

PRESENTATION OF DATA

Ground-Water Pumpage

Information on pumpage from the Carrizo aquifer during 1970-75 is based in part on questionnaires mailed annually by the Texas Department of Water Resources to municipalities and industries. The following procedure was used to estimate the amount of irrigation pumpage: (1) the annual number of cubic feet of natural gas and kilowatt-hours of electricity supplies to the irrigated farms from 1970 through 1975 was obtained from natural gas companies, power companies, and electrical cooperatives; (2) power and yield tests were conducted on selected irrigation wells to determine the average number of gallons produced per cubic foot and kilowatt hour; (3) the average number of gallons produced per cubic foot and kilowatt-hour was multiplied by the total number of cubic feet and kilowatt-hours supplied by natural gas companies, power companies, and electrical cooperatives to determine the approximate annual irrigation pumpage. Where power information was not available for individual irrigation wells, estimates of pumpage were made using empirical judgements based on weather, pump horsepower, and the individual's farming history.

Most of the water pumped from the Carrizo aquifer is used for irrigation. Zavala County used the largest quantity for irrigation in 1970 and Frio County used the largest amount during the period 1971 to 1975. Estimated use of ground water for irrigation, public supply, and industrial purposes from the Carrizo-Wilcox, Queen City-Bigford, and Sparta-Laredo aquifers during 1975 is shown in Table 1. About 279,000 acre-feet (344 hm^3) of ground water was produced from these

aquifers and about 94 percent was pumped from the Carrizo aquifer. Figure 2 shows the approximate pumpage from the Carrizo aquifer during the period

1930-1975 for irrigation, public supply, and industrial purposes in the Winter Garden district and the Winter Garden area.

Table 1.—Estimated Use of Ground Water for Irrigation, Public Supply, and Industrial Purposes From the Carrizo-Wilcox, Queen City-Bigford, and Sparta Laredo Aquifers, 1975

Aquifer	Public supply	Industrial	Irrigation	Total*
Carrizo-Wilcox	—	—	—	269,000
a) Carrizo	11,200	4,150	248,000	—
b) Wilcox	2,760	232	2,440	—
Queen City-Bigford	5,020	12	4,500	9,530
Sparta-Laredo	280	—	167	447
				Total 279,000

*Figures are approximate because some of the pumpage is estimated. Numbers are rounded to three significant figures. In addition to the amounts shown in the table, approximately 2,570 acre-feet was lost from uncontrolled flowing wells and approximately 13,800 acre-feet was used for domestic and livestock purposes from these aquifers.

Records of New Wells

Table 2 is a tabulation of well data for selected wells drilled between the Spring of 1970 and the Spring of 1977. Well locations are shown on Figure 6.

Water Levels

Water levels are presented in tabular form in Table 3, and the locations of the wells from which the water-level measurements were taken are shown on the well location map (Figure 6). The reader is referred to Texas Water Development Board Report 210, Volume II for descriptive data on those wells not listed in Table 2 of this report. The approximate altitude of water levels in wells measured in the Spring of 1976 are shown on Figure 3. The approximate change in water levels from 1929-30 to 1976 and from 1970 to 1976 are shown on Figures 4 and 5, respectively. Figure 4 shows that water levels have declined about 320 feet (98 m) in Zavala County northeast of Crystal City during the period 1929-30 to 1976. From 1970 to 1976 the largest water-level declines occurred in Zavala County in the area between La

Pryor Batesville, and Crystal City. The declines as indicated by Figure 5 generally range from less than 20 feet (6 m) to over 80 feet (24 m). For the same time period, water levels have risen in most of the central and eastern parts of Dimmit County.

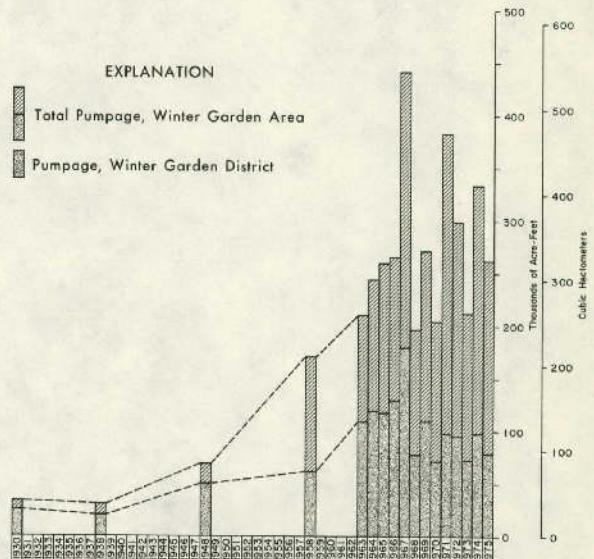

Figure 2.—Approximate Pumpage From the Carrizo Aquifer for Irrigation, Public Supply, and Industrial Use, 1930-75

Chemical Quality

A tabulation of chemical analyses is presented in Table 4, and the locations of the wells from which ground-water samples were collected are shown on the well location map (Figure 6). The reader is referred to Texas Water Development Board Report 210, Volume II

for descriptive data on those wells not listed in Table 2 of this report.

There have been no significant changes in the ground-water quality except on a local basis. Several wells in the Winter Garden district have experienced leaks in the casing which allowed undesirable water to enter the wells; however, remedial actions taken by the well owners eliminated the problems.

Table 2.--Records of Wells Drilled Between Spring 1970 and Spring 1977

All wells are drilled unless otherwise noted in remarks column.

Water Level : Reported water levels given in feet; measured water levels given to the nearest tenth or hundredth of a foot.

Method of lift and type of power: C, cylinder; cf, centrifugal; E, electric; G, gasoline, butane, or diesel engine; H, hand; N, none; Ng, natural gas; Sub, submersible; T, turbine; W, windmill. Number indicates horsepower.

Use of water : D, domestic; Ind, industrial; Irr, irrigation; N, none; P, public supply; S, livestock.

Water-bearing unit : Kcm, Edwards and associated limestones (Balcones Fault Zone aquifer); Twl, Wilcox Group; To, Carrizo Sand; Tb, Bigford Member; Tep, El Poco Clay; Tqc, Queen City Sand; Tla, Laredo Formation; Ts, Sparta Sand; Tus, Mount Selman Formation; Tom, Cook Mountain Formation; Ty, Yegua Formation; Tj, Jackson Group; Tct, Catahoula Tuff; Tok, Oakville Sandstone; Qle, Leonia Formation.

ATASCOSA COUNTY

Table 3.—Water Levels in Selected Wells

Water level measurements, in feet, below or above (+) land surface.

* Measurement affected by pumping (pumping level, well pumped recently, or well(s) pumping nearby).

Q Measurement may not be valid static level.

ATASCOSA COUNTY

Table 4.--Chemical Analyses of Water From Selected Wells

(Analyses given are in milligrams per liter except percent sodium, specific conductance, pH, sodium adsorption ratio, and residual sodium carbonate).

Water-bearing unit: Kccb, Edwards and associated limestones (Balcones Fault Zone aquifer); Twi, Wilcox Group; Tc, Carrizo Sand; Tb, Bigford Member; Tep, Pico Clay; Tqc, Queen City Sand; Tla, Laredo Formation; Ts, Sparta Sand; Tme, Mount Seaman Formation; Tcm, Cook Mountain Formation; Ty, Yegua Formation; Tj, Jackson Group; Tct, Catahoula Tuff; Tok, Oakville Sandstone; Qle, Leona Formation.

Dissolved Solids : The bicarbonate "reported" is converted by computation (multiplying by 0.4917) to an equivalent amount of carbonate, and the carbonate figure is used in the computation of this sum.

Well	Aquifer	Depth of well	Date of sample	Silica (SiO ₂)	Iron (Fe)	Calcium (Ca)	Magnesium (Mg)	Sodium (Na)	Potassium (K)	Bicarbonate (HCO ₃)	Sulfate (SO ₄)	Chloride (Cl)	Fluoride (F)	Nitrate (NO ₃)	Boron (B)	Dissolved solids	Total hardness as CaCO ₃	Specific conductance (micromhos at 25°C)	pH	Percent sodium	Sodium adsorption ratio (SAR)	Residual sodium carbonate (RSC)
